Job Description

- Contribute to design, architect and implement to moderately complex modules independently, or with support of a team under his/her technical direction, within a bigger application based on specific requirements.
- Demonstrate expertise in specific products and/or particular technical areas.
- Understanding of a range of technical areas, and deep knowledge in a few areas of specialization.
- Should be able to apply experience, intelligence, and creativity to resolve a wide range of issues; seeks guidance from other relevant experts on more complex issues (e.g., technical or business complexity).
- Knowledge of best practices and/or internal or external business issues to improve products/ services or processes.
- Must be able to work autonomously within broad objectives.
- May formally mentor junior staff and/or supervise the work of a small project team.
- Obtain and review requirements from Product Management indicating the business needs and functionalities of the proposed application.
- Engage in discussions with Product Management and others on the feasibility of the proposed application and the time necessary to accomplish the work.
- Create a high level design document that describes the approach to be taken and programming details.
- Partner with Senior Developers to contribute to development of a detailed design, specifying tables, fields, types of data to capture, etc.
- Must be able to code application instructions into the local environment.
- Review code to ensure compliance with coding standards and to ensure that defined requirements are met.
- Deploy new applications on to the development environment for testing. Fix if defects found. Repeat the testing cycle until the new application works flawlessly.
- Prepare related documentation.

- Review the programming code of other developers and makes comments or recommendations for improvements.
- Respond to and resolve escalated calls for technical assistance received from production support
